

Artificial Intelligence (AI) is the simulation of human intelligence in machines.

AI systems can perform tasks such as problem-solving, decision-making, and language understanding.

There are two main types of AI: Narrow AI and General AI.

- **Narrow AI** is designed for specific tasks, such as chatbots and recommendation systems.
- **General AI** can perform any intellectual task that a human can do, but it is still under research.

AI is used in various fields, including healthcare, finance, and automation.
